

Head of Risk Investigation Priority Brief

Growth reconciliation, Top 5 targets and control priorities

EXECUTIVE DECISION

Prioritise five users for immediate cross-functional investigation.

The selection is not a disguised transaction-volume ranking. Ninety per cent of the score reflects repeatability, statistical conviction, abnormality and attack breadth. Amount severity contributes ten per cent and is normalised within transaction type and currency.

MARKETING

78.17%

MANAGEMENT TAKEAWAYS

1 · Act now

Open coordinated investigations on the five ranked users, preserving evidence and mapping linked entities before customer-impacting action.

2 · Govern the KPI

Keep 71.74% as an internal sensitivity. It is stricter than Marketing's 78.17%, but the file cannot support a true app conversion or retention rate.

3 · Close data gaps

Add timestamps, realised loss, reversals, devices, counterparties and case outcomes before operationalising the ranking.

Decision standard. This report establishes an investigation queue, not a legal conclusion, automated restriction rule or attribution of attacker identity.

SECTION 01 · CONTEXT

Growth reconciliation and portfolio risk

The same denominator produces a 6.42-point gap once confirmed fraud and repeat use are made explicit.

Reconciliation. The total reduction is 449 users, or 6.42 percentage points, on the same cohort of 6,989 users observed exclusively as KYC PASSED.

Portfolio risk signal

Risk by transaction type

TYPE	ROWS	FRAUD	RATE
Bank transfer	15,858	1,230	7.76%
ATM	47,324	2,236	4.72%
Top up	132,561	3,792	2.86%
Card payment	436,570	6,849	1.57%
P2P	56,338	436	0.77%

Bank transfer has the highest event rate, while card payment generates the largest event count. Control allocation should therefore distinguish concentration from frequency.

What the growth rate does—and does not—say

Supported. The file supports a stricter behavioural proxy: at least two card-payment rows and no confirmed fraud among the same KYC-PASSED denominator.

Not supported. The file has no app installs, sign-up cohort, timestamps, settlement status or fixed fraud-maturation window. It cannot establish a true app funnel or retention rate.

Governance implication: label 71.74% as an internal sustainable-behaviour sensitivity. Do not silently replace a contemporaneous conversion KPI with an ex-post fraud outcome.

The five investigation priorities

All five combine sustained confirmed-fraud activity with multi-method breadth; amount alone does not determine rank.

RANK	USER ID	SCORE	EVENTS	METHODS	MARKETS	SEVERITY RANK
1	dc283b17-bbe1-4ae9-#b	99.4	1,029	5	11	1
2	b8271606-4633-4d8f-#b	97.8	340	5	3	6
3	25c2ecb3-5ec7-4fa6-#b	97.6	460	5	5	31
4	5c75c857-61f0-400e-#b	96.6	238	5	3	20
5	4ee8690a-ebf7-435b-#b	96.0	508	5	8	84

Why these five. Each user has confirmed fraud across all five observed transaction methods. The ranking then separates them through event persistence, conservative fraud-rate conviction, excess fraud versus expected transaction mix, cross-market breadth and a deliberately limited amount-severity signal.

Immediate escalation

Ranks 1 and 4 are observed with KYC state PENDING. That does not prove a control failure, but it makes onboarding and state-transition evidence an immediate review item.

Cross-functional response

Join transaction history with devices, IPs, beneficiaries, funding sources, prior alerts and linked-account evidence before deciding on restrictions or filings.

“Market” means distinct merchant country observed on fraud-labelled rows. It is an operational breadth signal, not an inference about attacker nationality.

SECTION 03 · INVESTIGATIVE RATIONALE

Why each target made the cut

The strongest signals are persistent, statistically convincing and operationally broad patterns.

96.0

EVENTS
508

METHODS
5

MARKETS
8

SEVERITY RANK
84

Investigative focus: Prioritise scale and dispersion. This user ranks only 84th on amount severity but has 508 confirmed events across eight merchant countries.

Observed KYC state: PASSED. All five users have a 100% confirmed-fraud rate in this file.

Selection discipline. A high composite score determines review order; it must not replace investigator judgement, customer-victim assessment or legally required case handling.

Why higher-amount users can rank below the Top 5

The counterfactual confirms that the model rewards sustained, broad and statistically convincing abuse—not merely large recorded amounts.

Selected #5 dominates four of five decision signals

Selected #5: 508 confirmed events across 5 methods and 8 merchant countries. Challenger: 41 events across 3 methods and 1 merchant country.

Counterfactual evidence

USER	SEV.	EVENTS	RANK
1632f5e0...63d3	99.7	41	91
11fa06ae...138a	99.3	63	54
5151da7c...5db3	99.0	113	22

These users show stronger normalised amount signals than several selected targets, but far fewer confirmed events and narrower behavioural footprints.

Model weights

- 30% Repeatability
- 25% Conservative fraud-rate conviction
- 20% Abnormality versus transaction mix
- 15% Method, merchant-country and currency breadth
- 10% Currency/type-normalised amount severity

Birth year, home country and other demographics are excluded. Mixed currencies are never summed. Non-positive amounts are excluded from severity scoring.

Recommended next actions

0–48 hours

Open the five cases, preserve evidence, and compare shared devices, IPs, counterparties, beneficiaries and funding sources.

Within 30 days

Back-test investigator outcomes, false positives and realised loss. Challenge weights and document any override.

Before production

Add timestamps, settlement and recovery data, network features and formal model approval. Keep human review in the decision loop.

Final control statement. This model is suitable for investigative triage on the supplied file. It is not suitable for automated customer restrictions, suspicious-activity filing decisions or public performance disclosure without enrichment and independent validation.
